Pharmaceuticals in Drinking Water

Nancy Mesner

Aquatic, Watershed and Earth Resources Utah State University

- Background on the Drinking Water Act
- Unregulated contaminantants
- Pharmaceuticals in drinking water
 - Sources
 - Treatment
 - Impacts

Safe Drinking Water Act (SDWA)

Enforceable health standards for dw contaminants

Public notification of water system violations

Protects underground sources of drinking water

State revolving loan fund for upgrades

Assessment of all drinking water sources for vulnerability to contamination

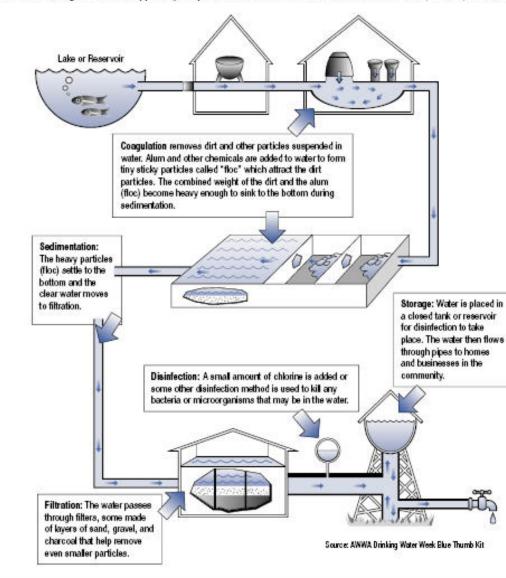

Public Water Systems

 serve piped water to at least 25 people or 15 service connections for at least 60 days/year

> Community water systems Eg. Most cities Non-community water systems Eg. School with its own system Eg. Public Campgrounds

Water Treatment Plant

Follow a drop of water from the source through the treatment process. Water may be treated differently in different communities depending on the quality of the water which enters the plant. Groundwater is located underground and typically requires less treatment than water from lakes, rivers, and streams.

Water Testing:

EPA establishes minimum testing schedules for public drinking systems.

Increases in frequency if problems occur

Testing and reporting of results is not consistent across the country

Primary Drinking Water Regulations

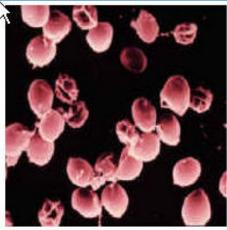

Micro-organisms eg. Cryptosporidium, Coliforms

Disinfection Byproducts eg. Chlorite, Total Trihalomethanes

Disinfectants Eg. Chlorine (as Cl₂)

Inorganic Chemicals Eg. Metals, nitrate

Organic chemicals Eg. Pesticides, industrial by-products

Secondary Drinking Water Regulations

Non enforceable guidelines concerning contaminants that may cause:

Cosmetic effects (skin or tooth discoloration)

Aesthetic effects (taste, odor or color in water) EPAs approach for evaluating new pollutants:

Drinking water Contaminant Candidate List

Regulatory Determination Priorities (based on occurrence and research priorities)

EPA has also established a National Drinking Water Contaminant Occurrence Database to support decision making and new regulations

And an Unregulated Contaminant Monitoring Regulation

Sources of pollutants

Point and non-point sources

Pharmaceuticals in DW

Sources:

Pharmaceutical industries Hospitals, medical facilities Households medicines Personal care products Farm animals

Endocrine disruptors

Sources:

Hospitals, medical facilities, households

Pesticides (may leach into gw, are persistent and fat soluble)

Industrial byproducts (eg. Dioxins/ pcbs)

Evidence of pharmaceuticals in the environment

>20 years ago

• aspirin, caffeine, and nicotine found in sewage treatment plants in U.S.

 USDA researchers found clofibric acid (cholesterol lowering drug) in groundwater infiltration basins

Studies which sounded the alarm:

 ~ 10 years ago, clofibric acid found beneath German treatment plant.

 mid 1990s, 30 of 60 pharmaceuticals tested for found in water samples

 Tulane University study: found low levels of drugs in Mississippi River, Lake Ponchetrain and in Tulane tape water

USGS study in 1999-2000

Tested for 95 pharmaceuticals, hormones and other organics

139 streams in 30 states.

82 found in at least one sample

80% of streams had 1 or more contaminant 54% of streams had > 5 contaminants 13% of streams had > 20 contaminants

General Findings:

Pharmaceuticals have now been found in treated sewage effluents, surface waters, soils and tap water.

Up to 90% of oral drugs can pass through humans unchanged.

Many do not biodegrade

Some persist in groundwater for years.

Amount of pharmaceuticals released unknown, but...

PPCPs released estimated to be ~ the same as amount of pesticides used each year.

U.S. may account for ~ ½ of pharmaceutical use in world (based on sales)

Impacts:

Mostly unknown

Concentrations in parts per trillion (well below therapeutic doses)

Concern about chronic exposure

- hormone disruption
- antibiotic resistance

Endocrine disruption:

Chemicals may:
mimic hormones (eg. DES)
block hormones (eg. DDE)
trigger abnormal response (eg. Dioxin)

Most evidence from fish and wildlife studies Links to human impacts not yet definitive

Possible problems include:

lower sperm counts, increased rate of breast, testicular, prostate cancer, increased incidence of hyperactivity and learning

Developing embryos probably most at risk

80% of adults and 90% of children in U.S. contain residues of 1 or more pesticides

Mothers who drink water with higher levels of ammonium perchlorate have babies with elevated thyroid stimulating hormone (indicator of hypothyroidism).

Male health trends:

Increased testicular cancer in England, Wales, other European countries

Decreased sperm count world wide over last 40 years.

- Increase in reproductive abnormalities
- Fewer male babies born

Female trends:

- > Breast cancer on rise
- Early puberty

Regional concerns:

- May be more critical in arid environments
 - GW recharge of treated sewage
 - Reuse of treated waste for irrigation
 - Natural streams contain greater percentage of effluent.

What to do:

Good news: chemicals with similar properties will probably respond the same way to treatment.

But...

Conventional wastewater treatment is relatively ineffective

Drinking water treatment is variable

Drinking water treatment technologies:

Highly effective techniques:

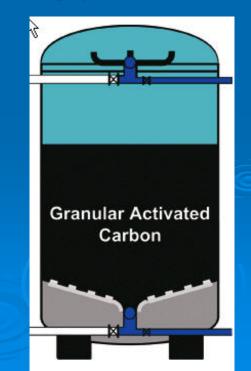

- Advanced oxidation removes many compounds
- Membrane filtration and filtration with Granular activated carbon
- Nano-filtration and reverse osmosis (eliminated all drugs)

Somewhat effective:

 Oxidation (eg. Conventional ozone) effective in transforming selected pharmaceuticals

Least effective techniques:

> Chlorine (most common in U.S.)

Other approaches:

Control what gets into environment:

Source control (medical disposal practices)

Design more environmentally friendly drugs

Minimize over use or misuse of drugs/chemicals

Point of use treatment of drugs

Add advance waste and water treatment technologies and source control at point of entry into environment.

Pharmaceuticals and Personal Care Products (PPCPs) as Ubiquitous Pollutants from Personal Use and Acti

Christian G. Daughton, Ph.D.

U.S. EPA, Office of Research and Development, National Exposure Research Laboratory, Environmental Sciences Division, Environmental Chemistry Branch, P.O. Box 93478, Las Vegas, Nexada 89193-3478 Email: daughton christian@epa.gov

EPA's research mission in context ---"Anticipatory Research and Emerging Pollutants"

A primary goal of the U.S. EPA's Office of Research and Development is to identify, foster, and perform investigation of potential future environmental issues/concerns before they become critical ecological or human health issues - proactive pollution prevention being preferable to reactive corrective actions.

BACKGROUND

The Israe Beyond the "Priority Pullyments": Economics during in efficiently by home activities primarily nin free waters - Indeter discosion financements rents — Indicat d'implicatifiquecontaine, adientien of community instanton (e.g., introduction of alian opecies), and chamical pollation. This scope of the formule two are legisly infrancente compared with the later. Descing the law three damates, the impact of chemical policities has investi alguni malasively on the new weak group transmit algorithms have been proved ground group of conventional "privatry politication". This class of algorithms, however, is only one priors of the large prizes. A storage of potential polition on receiving way little attaction include plarmamenticable and white hypothesis in previous large products of the physical and containably introduced to the
